

Recombinant STAT 3 Protein

Background

The Signal transducer and activator of transcription 3 (STAT 3), functions as a cytoplasmic mediator of cytokine signaling and nuclear transcription factor. STAT3 is considered as one of the most crucial member of the STAT family. STAT3 activation occurs via the phosphorylation of tyrosine residue (Y705) by JAK (Janus Kinase) and serine (S727) by MAPK and non-receptor tyrosine kinases. In particular STAT 3 activity is detected in a wide variety of tumors, driving multiple pro-oncogenic functions.
